SUMMARY

DevOps Engineer with 4+ years of experience across Azure and AWS in regulated healthcare, banking, and telecom. AZ-400 certified, with hands-on depth in Terraform and Bicep, AKS operations, GitOps through Azure DevOps and Argo CD, and Prometheus/Azure Monitor observability built on defined SLOs. Production on-call support experience in a regulated healthcare environment.

TECHNICAL SKILLS

Azure: AKS, Azure DevOps, Azure Container Registry, Virtual Networks & hub-and-spoke, Application Gateway, Key Vault, Azure Monitor, Log Analytics (KQL), Application Insights, Entra ID & Managed Identity, Azure Policy, Defender for Cloud, Landing Zones, ARM/Bicep

AWS: EKS, EC2, S3, VPC, IAM/IRSA, Lambda, RDS, Route 53, ALB/NLB, CloudWatch, Secrets Manager, KMS, CloudFormation

Containers & Orchestration: Kubernetes, Docker, Helm, Kustomize, AKS, EKS, OpenShift, ingress-nginx, HPA, KEDA, Cluster Autoscaler, Istio, admission control, StatefulSets

Infrastructure as Code: Terraform, Bicep/ARM, remote state & workspaces, module design, Ansible, CloudFormation, Checkov, tfsec, drift detection

CI/CD & GitOps: Azure DevOps Pipelines (YAML templates, environments, approval gates), GitHub Actions, Argo CD, Jenkins shared libraries, GitLab CI, Nexus, Artifactory, Maven, trunk-based development, blue-green & canary releases, automated rollback

Observability & Reliability: Azure Monitor, Log Analytics/KQL, Application Insights, Prometheus, Grafana, Loki, OpenTelemetry, Datadog, ELK, Splunk, Alertmanager, PagerDuty, SLI/SLO definition, error budgets, on-call rotation, incident response, blameless postmortems

Security & Compliance: Defender for Cloud, Azure Policy, OPA/Gatekeeper, SonarQube, Trivy, Snyk, least-privilege RBAC & IAM, Key Vault and Secrets Manager, secrets rotation, image scanning & signing, HIPAA and SOX-aligned change control

Languages & Systems: Python, Bash, KQL, YAML, SQL, Go (working knowledge), PowerShell, Linux (RHEL/Ubuntu), Git, TCP/IP, DNS, TLS, load balancing, Agile/Scrum

PROFESSIONAL EXPERIENCE

Molina Healthcare | Remote/US

May 2025 – Present

DevOps Engineer • Azure platform team supporting member-facing and claims workloads

- Managing the Terraform and Bicep codebase covering AKS, hub-and-spoke networking, and Key Vault. Refactored a hand-built environment into reusable modules with remote state and a Checkov gate, turning environment provisioning from a multi-day ticket queue into a same-morning task.
- Operate the AKS clusters behind member-facing and claims workloads across dev, staging, and production, including hybrid connectivity back to on-prem AD and DNS. After an enrollment surge pushed pods into CrashLoopBackOff, retuned HPA thresholds, resource requests, and the cluster autoscaler; peak latency returned to baseline and the pattern has not recurred.
- Moved application delivery to a GitOps model with Argo CD and Helm on top of Azure DevOps build pipelines. Teams merge to main and the cluster reconciles itself, which retired the weekly release coordination call and moved releases from scheduled batches to on-demand.
- Built the observability layer: Azure Monitor and Log Analytics alongside Prometheus and Grafana, with OpenTelemetry tracing and Loki for logs. Defined SLIs and error budgets for the tier-1 services, then retired the alerts nobody had acted on in six months so the remaining pages were ones people actually respond to.
- Carry the on-call pager on a shared rotation. Wrote runbooks for the most frequent alerts and ran blameless postmortems, which cut time to resolution on deployment-related incidents.
- Added Trivy, SonarQube, and Checkov gates to the Azure DevOps YAML pipelines, plus OPA/Gatekeeper and Azure Policy assignments that reject privileged containers and unsigned images at admission. HIPAA change-control evidence is now produced by the pipeline instead of assembled by hand every quarter.
- Wrote Python tooling used daily by the platform and application teams: a pre-deploy Terraform drift check, a post-deploy smoke-test runner, and a Slack bot that answers "what version is in prod right now."
- Manage secrets through Azure Key Vault with the CSI driver and workload identity, removing long-lived credentials from pipeline variables and repositories.

DevOps Engineer • *Short-term platform engagement supporting an AWS migration*

- Rebuilt Jenkins freestyle jobs as a shared-library pipeline, collapsing near-duplicate Groovy into one maintained path and cutting average build times.
- Wrote Terraform modules for EKS managed node groups, IRSA roles, and ALB ingress so application teams requested infrastructure through pull requests instead of tickets.
- Deployed containerized services to Amazon EKS with Helm and blue-green cutover, including automated rollback on failed health checks.
- Stood up CloudWatch and Grafana dashboards with Prometheus alerting for the services I supported, wired to the SOX change-control evidence trail auditors ask for.
- Replaced wildcard IAM policies with scoped roles and moved static access keys into Secrets Manager with scheduled rotation.

Verizon | Hyderabad, India

Feb 2021 – Nov 2023

Software Engineer • *Grew from application development into platform and release automation*

- Started on the application side and moved toward infrastructure over two years: began by scripting release tasks in Python and Bash, and by year two owned the team's Jenkins pipelines and container builds.
- Containerized legacy services with Docker multi-stage builds, separating build and runtime layers so images shipped without compilers or build caches, and making local development environments reproducible across the team.
- Built build-validation pipelines with automated unit and integration gates that caught failures before they reached QA.
- Cut the runtime of a heavily used reporting query by fixing missing indexes and an N+1 access pattern, and designed the REST APIs behind internal provisioning workflows.
- Shipped centralized logging with the ELK stack plus Grafana dashboards that became the first stop during incidents.

CERTIFICATIONS

- Microsoft Certified: DevOps Engineer Expert (**AZ-400**) — [Verify](#)
- Microsoft Certified: Azure Administrator Associate (**AZ-104**) — [Verify](#)
- AWS Certified Cloud Practitioner — [Verify](#)
- In progress: Certified Kubernetes Administrator (CKA), Azure Solutions Architect Expert (AZ-305)

RECENT PROJECTS

- **Event-driven job pipeline on AWS** (Terraform, Lambda, DynamoDB, EventBridge, API Gateway, CloudFront) — github.com/sudhamshrama/job-radar · [live dashboard](#)
Scheduled ingestion from 94 public job-board APIs into DynamoDB, defined entirely in Terraform with reusable modules and separate dev and prod compositions. Deployed by GitHub Actions using OIDC federation, so CI holds no long-lived AWS credentials, with Checkov gating, X-Ray tracing, and CloudWatch alarms. Runs inside the AWS always-free tier at zero cost.
- **Production delivery pipeline and GitOps configuration** (GitHub Actions, Trivy, Argo CD, Kustomize, Sealed Secrets) — [url-shortener](#) · [url-shortener-config](#)
Multi-architecture image builds with SBOM and signed provenance behind a Trivy gate that blocked a release on 11 HIGH CVEs before publish. Argo CD reconciles Kustomize overlays with auto-sync in development and approval gates in production, and every deploy arrives as a pull request pinned to a single image digest. Instrumented with Prometheus, Loki, and Jaeger tracing.
- **Container supply chain with admission enforcement** (Cosign, Sigstore, Kyverno, Syft, Grype, SLSA, OPA) — github.com/sudhamshrama/secure-supply-chain
Keyless signing through Fulcio and Rekor with a CycloneDX SBOM published as a signed attestation, verified by Kyverno at admission in enforce mode so unsigned images are rejected before they run. The vulnerability gate blocks on fixable findings rather than all 181, since a gate nobody can action gets switched off, and exceptions carry expiry dates that fail the build once passed.
- **SLOs and burn-rate alerting** (Prometheus, PromQL, Grafana, Kubernetes, k6) — github.com/sudhamshrama/slo-lab
Multi-window burn-rate alerts on availability and latency objectives using Google SRE Workbook thresholds, validated by fault injection rather than assumed: a 20 percent error injection paged in four and a half minutes and cleared four minutes after the fix, with the two indicators confirmed to burn independent budgets. Ships with Grafana dashboards, a runbook, and a written postmortem.

EDUCATION

M.S., Computer Science — University of Texas at Arlington

Jan 2024 – Dec 2025

B.Tech., Computer Science and Engineering — Guru Nanak Institutions (JNTUH)

2019 – 2023
